SupportIQ

AI support agents, built without code.

A self-hosted platform for building AI customer-support agents from an admin panel. Plug them into any website or app, ground them in your own documents and data, and hand off to a person when it matters.

FastAPI · LangGraph · LangChain · RAG + pgvector · Redis · MCP · Odoo

WHAT IT DOES

One platform for every support agent

Each agent is configuration, not code. An admin picks the model, writes the prompt, attaches knowledge and switches tools on or off. The agent's LangGraph is compiled at runtime and rebuilt whenever its setup changes.

🧩

No-code agents

Model, versioned prompts, knowledge bases and tools are set in the admin UI. A setup wizard and readiness checklist guide new agents.

🔀

Any model

OpenAI, Claude, Gemini, Ollama or any OpenAI-compatible API, with automatic fallback to a second model. Keys are encrypted at rest.

📚

Grounded answers

Upload PDFs, text or web pages. Hybrid search combines vector similarity and full-text search, and every answer shows its sources.

🛡️

Actions with guardrails

Tools look up orders, stock and warranties. Risky actions like refunds pause until a person approves them.

🙋

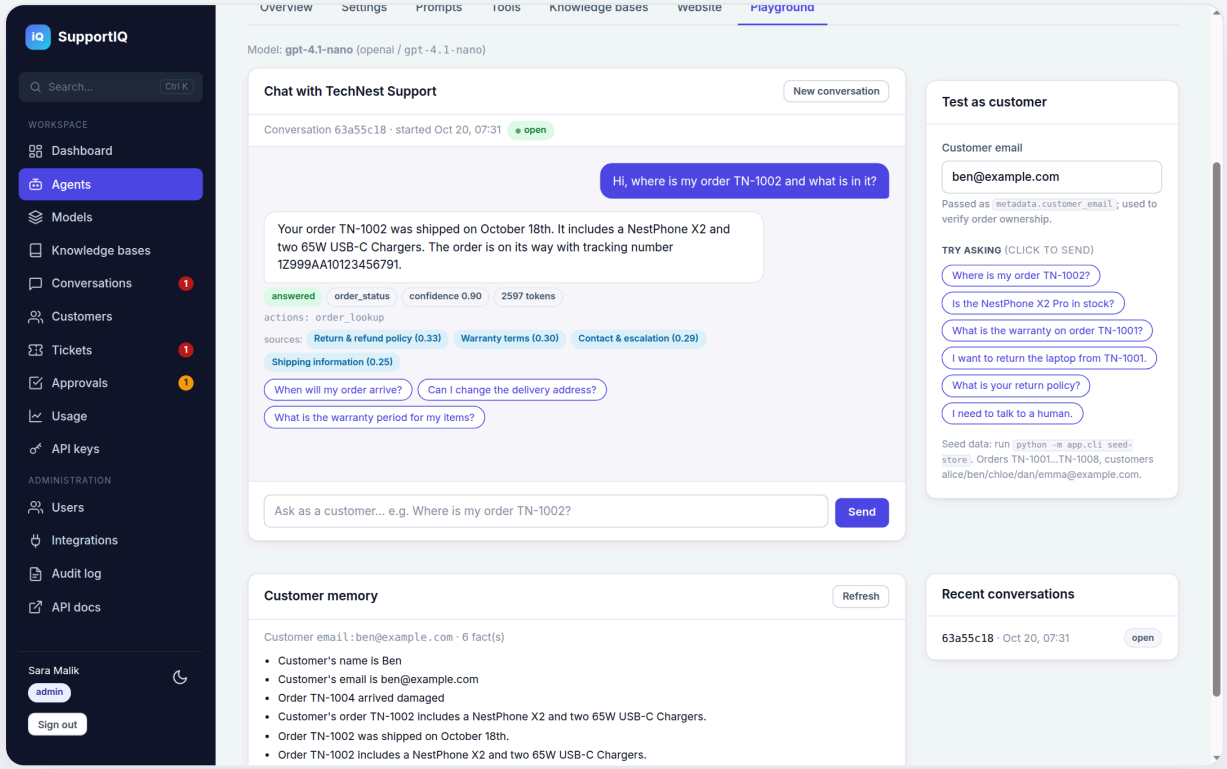

Human hand-off

Low confidence or a direct request escalates the chat, opens a ticket and pauses the bot. Staff get an AI summary and an AI-drafted reply.

🧠

Memory that scales

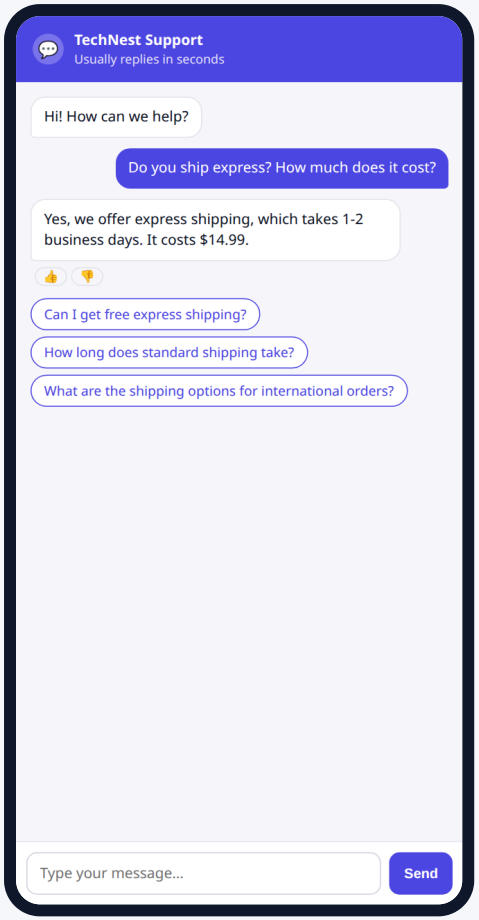

Running summaries keep long chats sharp, and the agent remembers key facts about each customer across conversations.

AGENT PLAYGROUND

See exactly how the agent thinks

- Test any agent as a real customer before it goes live.
- Every reply shows its intent, confidence, tool calls and document sources.
- Suggested follow-up questions appear as one-click chips.
- The customer-memory panel shows what the agent has learned.

WEBSITE WIDGET

One line of code on any website

Copy a single script tag into a website, Odoo page or shop. Public keys are locked to your domains, and a hosted chat page works as a shareable link.

Streaming replies

Answers appear word by word, formatted with lists, links and bold text.

Quick replies

Suggested next questions turn a chat into a guided flow.

Ratings and contact form

Optional pre-chat form and thumbs up or down on every answer.

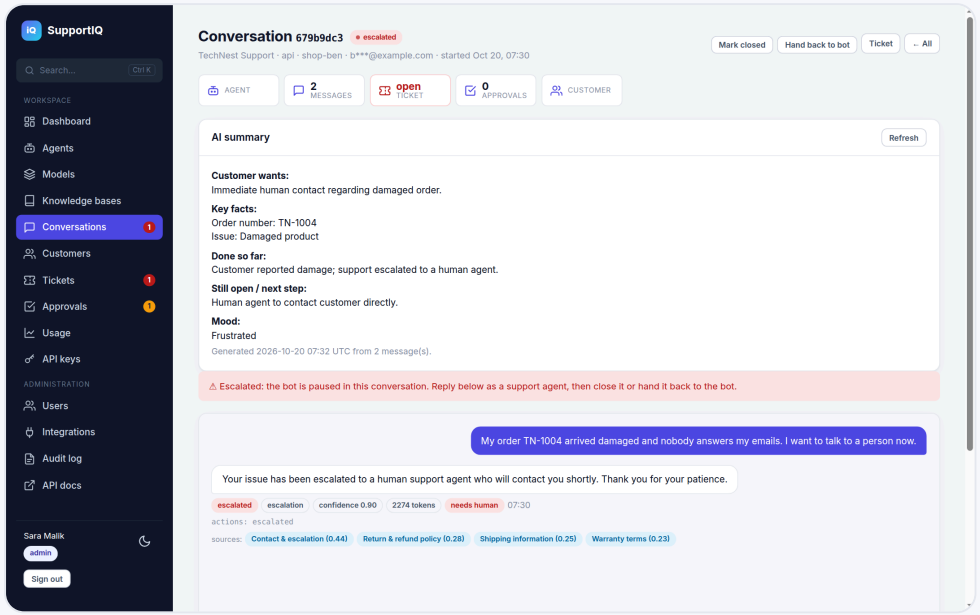

Live human replies

When staff take over, their messages appear in the same widget.

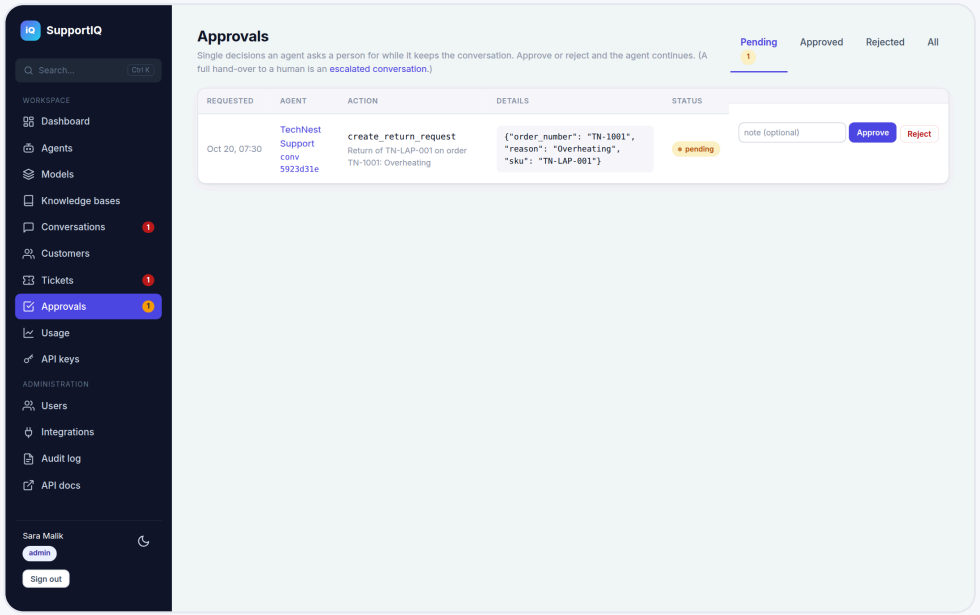

HUMAN IN THE LOOP

AI does the routine work, people keep control

Escalated chats land in a shared inbox with a ticket. One click gives a hand-over summary, and another drafts a reply the agent can edit before sending.

AI hand-over summary on an escalated conversation.

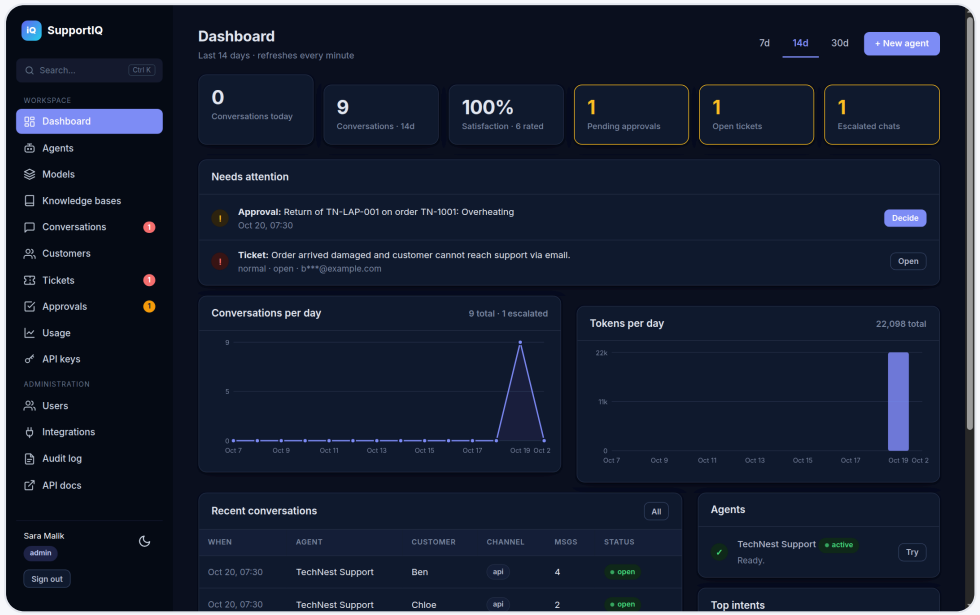

Refunds and other risky actions wait for approval.

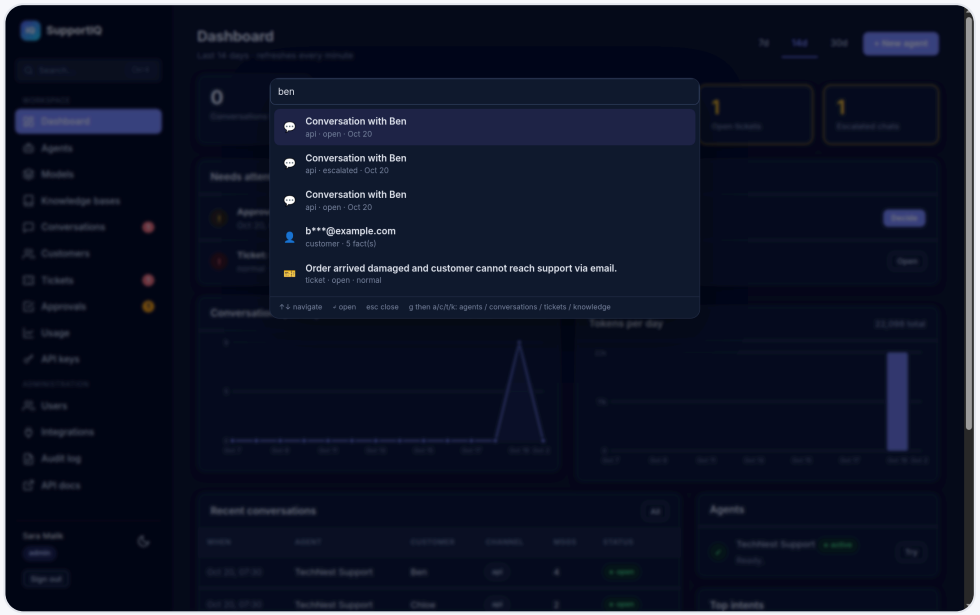

BUILT FOR DAILY USE

A modern admin that stays out of the way

A live dashboard, Ctrl+K search across everything, dark mode, smart navigation buttons and a layout that works on phones.

Dark mode dashboard with live charts.

Search agents, conversations, customers and tickets.

UNDER THE HOOD

How a message flows

Memory
Running summary and per-customer facts

→

Recall
Relevant older messages from long chats

→

Retrieve
Hybrid search over the agent's knowledge

→

Agent ⇄ Tools
LLM calls orders, stock, MCP tools

→

Approve
Risky actions pause for a person

→

Finalize
Intent, confidence, follow-ups, hand-off

Integrations

REST API with API keys, signed webhooks, MCP tool servers, an Odoo connector module and n8n-friendly endpoints.

Production basics

JWT roles, hashed and rate-limited API keys, audit log, retention jobs, SSRF protection, security headers, tracing hooks.

Quality

210 automated tests, evaluation suites for agents, Docker Compose deployment and one-command demo data.
